

HAND-HELD CLOTHING SPOT REMOVER

ABSTRACT OF THE DISCLOSURE

Disclosed herein is a hand-held cleaning device, as well as an associated method of cleaning a garment. The device comprises: a handle section having an interior and a garment cleaning solution reservoir located within the interior. The device further comprises a main section having a housing that defines an inner chamber, as well as a motor positioned within the inner chamber of the housing. The device also comprises a pump coupled to and powered by the motor, as well as a dirty fluid reservoir located at the bottom of the inner chamber. The device further includes a plurality of tubes connected to the pump and extending forwardly from the pump and terminating a plurality of solution dispensing spray jets. The device yet further includes a fan located in the inner chamber of the housing for creating a pressure differential to draw the dirty fluid material into the dirty fluid reservoir. Significantly, the handle section is removably coupled to the main section. A dual-use garment support surface and cleaning device storage bag can be included to provide support to a garment during cleaning by the cleaning device and to provide storage to the cleaning device when not in use.
